

Q. Tell me about yourself? (or) Introduce about yourself?

Ans: I am working as a devops Engineer from past 5 years, majorly i took part in creation of CI/CD pipeline. I created CI/CD pipeline from scratch using Jenkins pipeline. As soon as the developers commits the code in the git repository, Jenkins jobs will be triggered, it will pull from the source code from git repo & it would be compiled. Once after compiling it would run respective test cases & deployed.

I take care of writing the scripts to automate manual & repetitive tasks.

I take care of deployments where in i had to deploy the builds to QA, UAT [user accepting test], & production environment (client side)

I majorly involved in releases. Since we had frequent releases at the time of release, we create & merge the respective branches.

I had worked on AWS as the major cloud platform, where in i worked on services like VPC, EC2, S3, EBS, EFS, IAM roles, routes, ELB & autoscaling.

I also worked on docker, i have written docker files & reduce the docker image size. As well, with the help of multistage docker file.

I also worked on Kubernetes, where in we have created deployments with the help of helm charts. We have followed rolling update strategies for any updates in terms of Kubernetes.

I worked on Ansible as well, i am aware of ansible playbooks & i have fair understanding of ansible roles.

I worked on infrastructure as a code as well as well, i have good knowledge toward infra automation with the help of Terraform

Q] Tell me about your day to day activity?

Ans:- As soon as i login, first i will check the email, i will check any priority tickets which [Jira tickets] comes from SRE Team [Site Reliability Engineer] related to production and pre-production environments. If it comes, then i will work it as highest priority. In every sprint we keep some buffer time for this type of issues. This is how my day to day activity start.

After this i will check any developer's & QA team; if they are facing issues related to build, they will ping us if they face issue.

After all this i will start my regular sprint work, like Jenkins enables, webhooks starts, monitoring scripts, etc. Setting up CI/CD from scratch, setting up terraform, building a K8 cluster, writing a playbook in ansible.

NOTE: Regularly we don't get tickets, if there any issue, then only it will rise, we oftenly get weekly.

* If developers face any iss.

n) if developers, QA face any issue, they will ping us in ms. Team Channel.

* We use Microsoft Team Channel for communication.
